The invention relates to a method of detecting and differentiating

Co between lymphoid cell proliferative disorders associated with at least

cone gene and/or their regulatory regions in a subject by contacting a

target nucleic acid in a biological sample obtained from the subject with

at least one reagent or series of reagents that distinguish between

contacting an lond-methylated CDG dinuclectides within the target nucleic

acid. The genes and/or thair regulatory regions are preferably selected

from MDRI, CSNYEB, EGA, AR, CDK4, RB2, CDC25A, GPID beta, MYDD1, CDR3,

CF C From MDRI, CSNYEB, EGA, BAX, DAY, CDKA1B, CDKA1B, CDKA1B, THC-1, MGMT, MLH1, MOS, MYC, PTEN, RB12, TGFBR2, TP73, CDKA1E,

CG SKIDPLA, ARPRI, BAXI, BAX or HOXAS, Oligomers, peptide nucleic

acid (PNA)-oligomers and/or isolated nucleic acids based on the sequence

cof the genes are useful for detecting the methylation state of all the

CC for dinuclectides within one or more the sequences, or their complements,

CC for dinuclectides within one or more the sequences, or their complements

CC for determining the cytosine methylation state and or single nuclectide

CC polymorphisms (SNPS) and for differentiating at least two of the medical

CC conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma,

CC conditions between subclasses, disposition to,

differentiation between subclasses, disposition proper conditional cell proliferative disposition to,

monitoring of lymphoid cell proliferative disorder. This sequence Claim 30; SEQ ID NO 374; 448pp; English. above mentioned genes.

analyzing Producing sub-population of labeled nucleic acids, useful for analy differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers. WPI; 2002-314699/35.

Example 3; SEQ ID NO 400; 11pp; English

The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological

conditions to enzymatically generate sub-population of NAs, where each conditions to enzymatically generate sub-population of NAs, where each gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a single gene apecific primer. The cach labeled NA is generated using a single gene specific primer. The complementary state of the complementary of labeled NAs which is different physiological sources, where the method comprises producing subpopulation of labeled NAs for the RNA profiles between several comprising the populations for each physiological sources, differences in the population, where the comparison is preferably differences in the population, where the comparison is preferably confidences in the population, where the comparison is preferably confidences in the population, where the comparison is preferably confidences in the population, where the comparison is preferably confidences to an array of probe NAs stably associated with the sources, and comparing the patterns for each of the distinct sources, and comparing the patterns for each of the sources, where confidence of a substrate to produce a hybridiatation pattern for each of the sources, and comparing the patterns for each of the sources, where confidence is a substrate to reason of the sources, where confidence is a substrate of diseased a normal lissue of neoplastic a normal comparing of diseased a normal lissue e.g. neoplastic a normal comparing the sequence data for this patent did not form part of the printed confidence, but was obtained in electronic format directly from USPTO specification, but was obtained in electronic format directly from USPTO confidence in the printed confide

Novel flavonoid 3'-hydroxylase(s) from flowering plants - and corresponding DNA, used in the manipulation of pigmentation in plants.

Example 15; Page 59; 234pp; English,

Anchored poly(T) oligonucleotides polyT-anchA (AAT94667), polyT-anchC (AAT94668) and polyT-anchG (AAT94669) are complementary to the upstream region of a polyadenylation sequence. They were used to prime cDNA synthesis from snapdragon (Antirrhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome. P450 sequences (see also AAT94670-73). A CDNA clone (see AAT94657) encoding

```
This sequence represents a primer of the invention. The invention relates to gequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3; or (X)m5'-(gamma)N-(delta-N3; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = th/whine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = th/mine; A = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1;3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                       ö
flavonoid 3' hydroxylase (see AAW35704) was isolated using a differential display approach. This can be used to manipulate the pigmentation of transgenic plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides having at least two new nucleotides - useful as primers in RT-PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                 RT-PCR primer; DNA sequence determination; gene sequence analysis; ss

Sequences AAA07035-A07074 represent antisense oligonucleotides targetted to the human integrin beta 3 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human integrin beta 3 RNA, and were analysed for their effect on integrin beta 3 RNA, and were analysed for their effect on (glyceraldehyden-3-phosphate) mRNA levels were measured as a control. Integrins constitute one of four classes of cellular adhesion molecules, and play an important role in cell migration, cell anchorage to substrates and cytoahdesion signalling pathways. They are netrodimeric cation-dependent membrane glycoproteins composed of an alpha and beta subunit. Integrin beta 3 (also known as human endothellal glycoprotein.) GP3A, GPIIIa TrGB3, CD61 and platelet glycoprotein 33 is the common of the membrane of the membrane of the beta-3 subfamily of integrins. This family consists of the vitronectin receptor (alpha-T-beta-3) and the cytoahdesion-driven cellular restenosis, excessing this class of integrin can adhere to various matrix proteins and participate in various conditions such as vascular restenosis, excessive bone resorption and anglogenesis (in melanoma), tumour invasion, platelet aggregation and canderen the thrombasthenia. The oligonucleotides of the invention are useful for diseases mentioned above infermation, inflammation, inflammation, inflammation, inflammation, conditions and the diseases mentioned above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and
                                                                                                                                                       The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the ISSR-related PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Therapy and diagnosis of conditions involving telomerase using inhibitor - partic. for neoplasia, infection with pathogenic parasites and age-

                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                       New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and animal systems.
                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the ISSR-related PCR primer of the invention.

The present sequence can be used in a novel method for detecting a subtaryotic pathogen in a patient. The method comprises obtaining a sample of somatic tissue or calls from the patient, determining it telomerase activity is present and correlating this with the presence of the abthogen. The method is useful for diagnosis of fungal infections, especially a fungus of the genus Candida, Kluyveromyces, Saccharomyces, Sporothrix, Coccidioides, Histoplasma, Blastomyces, Paracoccidioides, especially a beservallus, Mucor or Rhizopus, or malarial infections, especially plasmodium vivax, P. ovale, P. malariae or P. falciparum. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                 The sequences given in AAOS113B-46 represent telomeric sequences derived from various budding yeast species. There is a great variety in the length and sequence complexity of these sequences compared to those of other eukaryotes, yet they all have a 6 base conserved region at the 3' end. The telomeric relationships between these yeasts is fairly consistent with the phylogenetic relationship and it has been shown that C. tropicalis contains at least two forms of telomeric sequences. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-WAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of eukaryotic pathogens, especially fungal or Plasmodium spp. by detecting telomerase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection, eukaryotic pathogen; telomeric nucleic acid sequence; telomerase activity; diagnosis; fungal infection; fungus; fungi; malaria; es.

The invention relates to a substantially purified or isolated nucleic acid [1] from rygrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly respeated nucleotide core elements of nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (MI) an SSR by preparing a library of rygrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of rygrass. Or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a sectiated with the gene such that the SSR and the gene are preferritably co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR variaties and testing the purity of grass or cereal species variation breeding, the second patches by assessing variation within seed barches in the selection of genes in grass or cereal species variation breeding, for profiling grass or cereal species variation breeding, for profiling grass or cereal species variation breeding to establish the distinct identity, uniformity and for DNA profiling to establish the distinct identity, uniformity and for DNA profiling to establish the sequence is a ryegrass or fescue SSR
                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                   Simple sequence repeat; plant, ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.

The invention describes a method use for treating increased rate of proliferation of a cell or extending the ability of a cell to replicate, or treating a disease associated with cell sensecence. The method comprises administering an agent to reduce loss of telomers length within the cell during proliferation or replication, or to derepress telomerase to the sensecing cells. The method is useful for treating a condition associated with an increased rate of proliferation of a cell extending the ability of a cell to replicate, or for treating a disease or condition associated with cell sensecence e.g. neoplasia. A second method disclosed in the invention is useful for treating a condition associated with an elevated level of telomerase activity within a cell e.g. cancer. Also disclosed is a method useful for diagnosis of a condition associated with an increased rate of proliferation in a cell in an individual e.g. age-related manular degeneration, astrocytes associated with his called matular degeneration, astrocytes associated with his sequence represents a polynucleotide used in the study of telomere length sequence represents a polynucleotide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating condition associated with cell senescence or increased rate of cell proliferation, by administering to cell an agent that derepresses telomerase in the senescing cells or that reduces loss of telomere
                                                                                                                                                                                                                                                                                                                                                                                 Cell proliferation; cell senescence; telomere length; telomerase activity; cel replication; neoplasia; cancer; age-related macular degeneration; Alzheimer's disease; atherosclerosis; telomerase; telomerase inhibitor; immortalised cell; ss.
                                                                                                                                                                                                                                                                                                                                                Telomere length and/or telomerase activity related polynucleotide #57.

The nanocircle of the invention demonstrates cytostatic and ophical activities and may be useful during the diagnosis and treatment of cancer, liver degeneration, macular degeneration and skin aging, as well as during gene literapy procedures. Purthermore, the nanocircle may be used to extend the lifespan of non-cancercus cell populations in culture, providing enhanced materials for biomedical research, tissue enginering and contract sequence is that of the Gaccharomyces cerevisiae telomere repeat sequence is that of the Gaccharomyces sequence is not displayed within the specification per se but was created

The sequences given in AAQ35675-90 were used in the construction of NYVAC based recombinants expressing the EHV-1 gB, gC and gD glycoprotein chomologs. Expression of the EHV-1 gB glycoprotein was accomplished by putting the EHV-1 gB bomolog gene under the control of the vaccinia virus 13L promoter. The EHV-1 gC gene was expressed by placing the homolog gene under the control of the vaccinia virus H6 promoter and the EHV-90 conder the control of the vaccinia virus H6 promoter and the EHV-90 conder the control of the entomopox virus 42 kD gene promoter. The homolog genes were derived by polymerase chain reaction (PCR) and were inserted into the ATI and HA delection loci of NYVAC. NYVAC is a Copenhagen vaccine strain of vaccinia virus which has been modified by deletion of six non-essential regions of the genome encoding known or potential virulence factors. The foreign genes. See also AAQ35501-864. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine comprises recombinant, attenuated pox-virus - use for vaccinating against viral infections such as rabies, hepatitis B, HIV, HSV, EBV, CMV,

```
The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not corn secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage;

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGP). A patient (preferably human) having a condition associated with the level of the free-like tyrosinh kinase 1 (fil-1), kinase insert domain containing receptor (XDR) and/or foceal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67575 to AAX7572 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Feline herpes virus type 1; FHV-1; vaccine; poxvirus; ALVAC; vCP243; canarypox virus; antigen; vector; primer; PCR; polymerase chain reaction; pJCA109; pJCA080; ss.

PCR primers (AAT47159-78) were used in the construction of plasmid intermediates used in the generation of donor plasmid pJCA109. This plasmid is required for the insertion of genes encoding the felline herpes virus (FHV-1) homologues of gB, gC and gD under control of the 111, H6 and 42K promoters, respectively, into the C6 site of an ALVAC vector. Recombinant vCP243 is generated. Primers RG286 (AAT47175) and M13F (AAT47176) were used to synthesise by PCR a 130 bp EcoRI-blunt fragment contg, the 42K promoter using pJCA038 as template. The amplified fragment was used in the construction of intermediate plasmid pJCA088
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, c-raf, A-raf, B-raf, hammerhead ribozyme, hairpin ribozyme, target, substrate; catalyst; modulation; expression; Raf gene; delivery; screening; identification; synthesis, deprotection; purification; cancer; inflammation; psoriasis; non-hepatic ascites; infection; genetic drift; restenosis; rheumatoid arthritis; ss.
                                                                                                                   Compsn. for inducing immunological response, esp. in dogs - comprises recombinant virus or expression prod., and additional antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bellon L;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Jarvis T, Matulic-Adamic J, Reynolds M, Kisich K, Bellon L,

```
This invention describes a method for mass-spectrometric analysis of known genetic mutations, using modified nucleoside triphosphates to improve the performance. The method compises: (1) amplifying a DNA sequence by polymerase chain reaction (PCR) using primers selected to sequence by polymerase chain reaction (PCR) using primers selected to amplify a sequence containing the mutation; (2) adding a particular set of modified nucleoside triphosphates (NTPS) to effect infited extension of already present or newly added primers, where: (a) the extension of already present or newly added primers, where: (a) the extension of already present or newly added primers, where: (a) the extension of the mutation site, so that wild-type amplification products will have a different molecular weight from mutant amplification products; and (c) the mutation of the NTPS results in stabilization of the DNA chains; (3) during ionization, a reduction in ion adduct formation, an increase in ionization yields and/or a change in the mass of the DNA chains; (3) erforming the limited primer extension using an enzyme that generates the complement of the DNA strand being copied; (4) performing at least partial primer degradation and optionally further modification of the mutation amplification products by mass spectrometry and assigning the masses to wild type or mutant. AAZ43691-Z43717 represent primers used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 6 A; 2 C; 4 G; 5 T; 0 U; 0 Other;

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate nucleic acid (A') that modulates expression of the oestrogen receptor oncleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
                                                                                                                                                                                                                                                             ö
herpes virus glycoprotein D (gD) gene is expressed under control of the 42K promoter. The gD gene is used to generate a live recombinant vaccine which comprises: (1) a viral vector including, and expressing in vivo, a heterologous nucleotide sequence particularly a gene from a pathogen; and (2) at least one adjuvant, i.e. a (methhacrylic acid polymer or a copolymer of maleic anhydride and alkenyl derivatives. The vaccines are used particularly to protect against animal herpes or influenza viruses, but also feline leukemia, tetanus and canine distemper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acids that interact, and optionally cleave, target sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Destrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1682

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of estrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, caregents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences.

AAA24748 to AAAA2592 represent their corresponding target sequences. AAA225931 to AAA24748
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acids that interact, and optionally cleave, target sequences,
AAA24748 to AAA25992 represent their corresponding target sequences. AAA25993 to AAA36105 represent oestrogen receptor hairpin ribozyme sequences, and AAA36107 to AAA326218 represent their corresponding targe sequences. AAA326219 to AAA32271 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1683

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the cool on the single base pair canges introduces a premature stop codon in HTPL.8 (8 for short) compared to HTPL-1 (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human
                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
sequences, and AAA26107 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26271 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV79762 and ABB98559 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome lopl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potential therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, numbur angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge wheber syndrome, rippel-Trenaunay-Weber syndrome, oster-Weber-rendu for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for
                                                                                                                                                                                                                                                                            ö
therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human PTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Bwing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; studye Weber syndrome; Kippel-Trenaunay weber syndrome; leuksemia; si Osler-Weber-rendu syndrome; leukaemia; osteoporosis; DNAzyme; inozyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotide which down regulates expression of Ets-related gen
useful for treating cancer, diabetic retinopathy, macular degeneration,
arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Randi

the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (1) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a call, by contacting the cell with (I). (I) is useful for neaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ARK17354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and carzymatic nucleic acid molecules which regulate expression of ERG, and carzymatic nucleic acid molecules which regulate expression of ERG, and carzymatic enzymention

WPI; 2003-250498/25.

New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.

Claim 1; Page 57; 798pp; French

The with tunnour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identities to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration sequence represents an isolated nucleic acid sequence associated

The invention relates to a novel isolated 17 mer nucleic acid sequence, cgiven in the specification, a sequence containing at least 15 consecutive given in the specification, a sequence a sequence with, after optimal and incleotides from the 17 mer sequence with, after optimal anyone in the least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of hybridizes to them under highly stringent conditions, or the complement of acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a mucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for component of a gene chip, in vitro as (anti) sense reagents, and for component of a recombinant polypeptides. Any of the nucleic acids, colypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for vector or antibodies directed against the polypeptides are useful for greatent of tumours or cell diseases that are characterised by development of tumours or cell containing the expression of the 17 mer nucleic acids in containing the expression of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and chipser the nucleic acid sequence represents a tumour suppression cheared human fukutin oligonucleotide of the invention

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, controllying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombnant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (by viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or viral infections or diseases. The nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides can be used for diagnosis and be used to screen for their specific interactive molecules.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characetrised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 89 identity, after optimal alignment, with the nucleotides, or the complement, or corresponding the nucleotides, or the complement, or corresponding RNA, of the nucleotides are used as probes or primers for detecting, identifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombrant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides and polypeptides can be used to screen for their specific interactive molecules, and also be used to screen for their specific interactive molecules.
cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1.4%; Score 14.4; DB 1; Length 17; 93.8%; Pred. ```
Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                        The specification describes a process for circularizing an oligomorlectide around a double-stranded nucleic acid that contains a target sequence. The method is used to detect or label nucleic acids, particularly plasmids, to detect target sequences in the nucleic acid, particularly plasmids between two sequences that differ in only 1 or 2 muctations. It can be used to select, e.g. from degenerate single-stranded nucleic acids, sequences that can bind to the nucleic acid, particularly sequences that promote entry of the nucleic acid into cells or can target the nucleic acid into cells or can target the nucleic acid in specific callular compartments. The method can also be used to purify nucleic acids, particularly plasmids, and in gene therapy for specific inhibition of a gene contained in the nucleic acid. The present sequence represents an oligomorlectide used in the course of the invention, during construction of a triple helix
                                                                                                                                             Circularizing oligonucleotide around double-stranded nucleic acid, usefule.g. for detecting mutations, using target-binding oligonucleotide with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence coned. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without and AA030226-447. (Updated on 25-MAR-2003 to correct PD field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to antisense oligonuclectides targeted to a nucleic acid molecule encoding human Survivin, where the antisense oligonuclectide inhibits the expression of human Survivin. These antisense oligonuclectides are used in the treatment of an animal suffering from a disease or condition associated with Survivin, e.g. a hyperproliferative condition such as cancer, and comprises administering a therapeutically or prophylactically effective amount of the antisense oligonuclectide so that expression of Survivin is inhibited. The oligonuclectides can also be used to treat a human suffering from a disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonuclectide to a human. In addition, the antisense oligonuclectide and a cytotoxic chemotherapeutic agent e.g.
                              The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABISO12-ABIS1809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islart in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compounds for modulating the expression of Survivin and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-da)n.(dg-dr)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-66610 human genes. This repeat sequence so flow informativeness found in specific human genes. This repeat sequence is found in the epsilon hamoglobin gene located at chromosomal position llpls.5. The sequence is applified by primers AAT66088-9. (Updated on 25-MAR-2003 to correct PF
taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the cell cycle, or inhibit the proliferation in a cancer cell by contacting the cell with the antisense oligonucleotide. AAS1521-AAS21768 represent Survivin nucleic acids, and antisense oligonucleotides targeted to Survivin, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA298483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Simple sequence repeat; plant; ds, SSR, ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements or repeat (SSR), having 2 or more tandemly repeated nucleotide core elements cuttable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SRRs and core identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely core associated with the gene such that the SSR and the gene are section between SSR varieties and electing for the SSR in the breeding, a preferentially co-inherited, and selecting for the SSR in the breeding, and cereal species varieties by assessing variation within seed batch of an SSR. The SSRs core and be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the constance is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                              New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Syntheric oligonucleotide, dinucleotide repeat; cytostatic; apoptosis; cell cycle arrest; cell proliferation; caspase; cytokine; interleukin; tumour necrosis factor; TNF; cancer; carcinoma; sarcoma; leukemia;

The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3 'OH, 5 'OH synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing call cycle arrest, inhibition of proliferation, cutivation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TMF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGP)-beta 1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 mucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNR. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed barches. The present sequence is a SSR motif, which
                                                                                                                                                                             Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, ds, UG71A1, promoter, Gilbert's syndrome, hyperbilirubinaemia, uridine diphosphate glucuronosyltransferase, Crigler-Najjar syndrome, UG7; polymorphism detection; TA repeat; glucuronidation; Irinotecan;

where the presence of the five TA repeats correlates with intreased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter. (M1) is useful for screening individuals for variation in glucuronidation activity, for optimising drug dosages for a patient, where the drugs (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (preferably COT GUTLA1) and the activity of the drug is effected by its level of individual, amplifying all or part of a UGT gene promoter (GUTLA1 gene promoter) contained in the DNA and determining the number of TA repeats COT in the promoter. Thus the DNA being amplified comprises all or part of UGTLA1 promoter. The DNA is amplified by g polymerase chain reaction and the promoter. The DNA is amplified by glocymerase chain reaction and the number of TA repeats is determined by gel electrophoresis or by sequencing the amplified DNA. The polymorphism comprises an allele consisting of five TA repeats (TA) 5, six TA repeats (TA) 5, (TA) 8, (TA) 8, (TA) 8, (TA) 8, (TA) 8, (TA) 9, (TA) 8, (TA) 8, (TA) 8, (TA) 8, (TA) 8, (TA) 9, 
The invention relates to detecting (MI) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased.

gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in polymorphisms in uridine diphosphate glucuronosyltransferase Detecting

Claim 7; Col 17; 13pp; English.

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronsyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter. (M1) is conscreening individuals for variation in glucuronidation activity, for optimising drug dosages for a patient, where the drugs (G. irinotecan or TAS-103) are glucuronidated by UGT (preferably UGTIA) and the activity of the drug is effected by its level of contrained in the method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTIA) gene contained in the DNA baing amplified comprises all or part of in the promoter. Thus the DNA baing amplified comprises all or part of the number of TA repeats is determined by a polymerase chain reaction and the number of TA repeats is determined by gel electrophoresis or by capeats (TA) 7. The promoter has any one of the genotypes (TA) 5. (TA) 6. (TA) 7. (TA) 8. (M1) is also useful for predicting an individuals sensitivity to xenobiotics that are glucuronidated by a UGT (preferably contexts in a UGT gene, promoter, where the number of TA repeats CTA) 5. (TA) 5. (TA) 5. (TA) 6. (TA) 7. (TA) 8. (M1) is also useful for predicting an individuals sensitivity to xenobiotics that are glucuronidated by a UGT (Preferably to xenobiotics that are glucuronidated by a UGT (Preferably to xenobiotics that are glucuronidated by a UGT (Preferably involve determining the promoter. Where the number of TA repeats in a UGT gene promoter, where the number of a preferably involve determining the promoter. Defects in glucurodination is associated with repeats in the promoter. Defects in glucurodination is essentiated with the promoter. Defects in glucurodination is essentiated by the UGT gene, and the indivi

                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                   The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidiane-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                   Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human uridine diphosphate glucuronosyltransferase gene polymorphism #10.

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-ademine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter, preferably a UGT I (UGTIAI) agene promoter. (M1) is activity, for optimising drug dosages for a patient, where the drugs (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (preferably UGTIAI) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTIAI) gene promoter (UGTIAI) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably QUITAL). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug desages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting polymorphisms in uridine diphosphate glucuronosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, ds, UGT1A1, promoter, Gilbert's syndrome, hyperbilirubinaemia, uridine diphosphate glucuronosyltransferase, Crigler-Najjar syndrome, UGT, polymorphism detection, TA repeat, glucuronidation, Irinotecan, TAS-103, xenobiotic.

in the promoter. Thus the DNA being amplified comprises all or part of UGTIA1 promoter. The DNA is amplified by a polymerase chain reaction and the mumber of TA repeats is determined by gel electrophoresis or by sequencing the amplified DNA. The polymorphism comprises an allele consisting of five TA repeats (TA)5, or seven TA repeats (TA)7. The promoter has any one of the genotypes (TA)5, or seven TA (TA)5 (TA)6, (TA)5/(TA)7, (TA)8, (TA)6/(TA)8, (TA)7/(TA)8, (TA)6/(TA)8, (TA)7/(TA)8, (TA)6/(TA)8, (TA)7/(TA)8, (TA)7/(TA)8, (TA)6/(TA)8, (TA)7/(TA)8, (TA)6/(TA)8, (TA)7/(TA)8, (TA)6/(TA)8, (TA)7/(TA)8, (TA)6/(TA)8, (TA)6/(TA)6/(TA)6/(TA)6/(TA)8, (TA)6/(TA)6/(TA)6/(TA)6/(TA)6/(TA)9, (TA)6/(TA)9, (TA)6/(TA)6/(TA)9, (TA)6/(TA)6/(TA)9, (TA)6/(TA)6/(TA)9, (TA)6/(TA)6/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)9/(TA)

gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in polymorphisms in uridine diphosphate glucuronosyltransferase the promoter. Detecting

Example 6; Col 11; 13pp; English.

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter, preferably a UGT I (UGTIAL) gene promoter. (M1) is

The invention comprises a method for detecting polymorphisms in a uridine

userul for Screening non-vigurals for a patient, where the drugs activity, for optimising drug desages for a patient, where the drugs cactivity, for optimising drug desages for a patient, where the drugs of activity of the drug is effected by its level of gruntland and the activity of the drug is effected by its level of gruntland in the DNA and determining the number of TA repeats or promoter. Thus the DNA haid amplified comprises all or part of in the promoter. Thus the DNA haid maplified comprises all or part of the promoter. The DNA is amplified by a polymerase chain reaction and the under of TA repeats is determined by gel electrophoresis or by sequencing the amplified DNA. The polymorphism comprises an allele consisting of five TA repeats (TA) 5, six TA repeats (TA) 5, (TA) Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter. Human uridine diphosphate glucuronosyltransferase gene polymorphism #12. Human; polymorphism; TA repeat; ds; UGT; thymidine-adenine repeat; uridine diphosphate glucuronosyltransferase gene promoter; UGTLA1; drug dosage optimisation; xenobiotic sensitivity. useful for screening individuals for variation in glucuronidation .. 0 1.3%; Score 14; DB 1; Length 15; 100.0%; Pred. The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTALAI). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting polymorphisms in uridine diphosphate glucuronosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human uridine diphosphate glucuronosyltransferase gene polymorphism

```
The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human a-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb, for treating restenosis or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments. Jigating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSN), and an adaptor segment. The present sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer. The method is partic, useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons
                                                                                                                                                                                                                                                                                                                                                                                    Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.

                                                                                                                                                                                                                The specification describes a method for determining a nucleotide sequence signature. The method comprises obtaining optical measurements with values indicating each nucleotide in a group of nucleotide positions, adjusting the values until the ratio of highest value in the set to next highest values in the set is at least a predetermined factor, and generating a base call for a position in the group based on results after the adjustment of values. The method is used for determining a signature of a nucleotide sequence, and for determining a nucleotide sequence of a polynucleotide from a series of optical measurements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss;

fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, clantifying and/or amplifying nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (AD) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules, the nucleotide for prevention also be used to screen for their specific interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve thair nuclease resistance. The ribozymes clave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-WAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                     The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave hyperproliferation in restenosis, especially after coronary angioplasty, and in cancers
                                                                                                                                                                                                                New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-\pi y b, for treating restenosis or cancer.

A patient
                                                                                                                                                                                                                    Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer directed primer, comprising of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is modified amplified fragment polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; XDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; Kinase insert domain containing receptor;
Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vaccular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyzosine kinase 1 (fl.1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                           ..

A patient (preferably human) having a condition associated with the level of the fms-1ke tyrosine kinase 1 (Ell-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.

Claim 177; Page 154; 259pp; English.

capable of medulating a process in a biological system. The method capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic comprises: (a) introducing into the system a random library of nucleic confactalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of ar least part of the SBDs in such systems. Nucleic acid molecules with cendonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and custant cancer, restenosis, psoriasis of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or center modifications in addition associated with the level of c-raf. Introduction of super/phosphate modifications in discasses stability against nuclease and cutivity AAV99022 to AAV93877 represent NACE that can be used in the method has been developed for the identification of a nucleic acid method, specifically for modulating the expression of a Raf gene

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta any; ,or (X)m5'-(agamma) k-(delta-N3'), where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thywine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or vytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, quanine and/or cytosine. The new nucleotides are useful as primers for KT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene Disclosure; Page 11; 19pp; Japanese. sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RGG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is a risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to
                                                                                                                                                                                                                                                                                                                                           Detection of single nuclectide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, single nucleotide polymorphism, SNP, genotyping, DNA analysis, allele specific oligonucleotide, ASO, reduced complexity genome, RCG, genomic classification; identification, DNA fingerprinting, tumour characterisation, hybridisation, SS.

```
A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and annalysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is a risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to AAA3632 represent nucleotide sequences containing SNPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               preparation
                                                                                                                                 Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; single nucleotide polymorphism; SNP; genotyping; DNA analysis; allele specific oligonucleotide; ASO; reduced complexity genome; RCG; genomic classification; identification; DNA fingerprinting; tumour characterisation; hybridisation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method has been developed for detecting the presence or absence of single nucleotide polymorphism (SNP) allele in a genomic sample. A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to

with a target sequence and contain at least one phosphoro(di)[hioate (III., having endonuclease activity. (A), and more generally any catalytic link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A) that modulates expression of the oestrogen receptor gene, are used to treat cancer [particularly of breast or endometrium). (C) in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. (C) particularly for the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, (C) particularly for identification of therapeutic targets, and as research cragents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves (AAA214747 represent oestrogen receptor hardrens sequences, and AAA2148 to AAA22010 represent their corresponding target sequences. (C) AAA22148 to AAA22010 represent their corresponding target (C) AAA22010 represent their corresponding target (C) AAA22010 represent cestrogen receptor hardrens and C) sequences, and AAA26107 to AAA26107 to AAA26107 represent their corresponding target (C) and C) a

nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer

Claim 77; Page 71; 148pp; English.

The present invention describes mucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of estrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of the restriction endonucleases are reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAAA23503 to AAA2593 to AAA2592 represent ceptor hancehording target sequences.

AAA25931 to AAA26105 represent oestrogen receptor hairpin ribozyme sequences.

AAA25931 to AAA26107 to AAAA6618 represent their corresponding target sequences. AAAA26219 to AAAA2621 to Expresent other ribozyme sequences and entitions oligonucleotides used in the exemplification of the present

This invention describes a novel retroviral expression vector (A) containing DNA sequences (I) for packaging vector RNA and for cell-containing DNA sequences or peptides encoding by heterologous DNA specific expression contain a cell-containing the sequences controlling cell-specific expression contain a cell-capecific and elucaryotic cells containing (A); (b) prokaryotic and elucaryotic cells containing (A); (c) entroded for a containing a retroviral expression vector RNA derived from (A); (e) a containing a retroviral expression vector RNA derived from (A); (e) a containing a retroviral expression cell (G); (f) a method for incorporating protein-encoding nucleic acid sequences into a eukaryotic cell by infection with the virions of (d); (f) a method for incorporating containing (A) and a packaging cell line, that contains at least one infection with a packaging cell line, that contains at least one (receip genes for gene therapy and to produce virions for introducing (I) into the chromosomal DNA of eukaryotic cells, preferably mammalian and specifically human. (A) retain the advantages of usual retroviral contains at sequences with all the signal structures required for transcription in a contain region within the U3-R sequence, they do not introduce any new viral sequences into the genome and recombination will not create new contains and recoving and sequences, they do not introduce any new viral sequences into the genome and recombination will not create new contains and recovering and sequences in a packaging contains and recombination will not create new contains and recovering and recovering and sequences in a packaging contains and recombination will not create new contains and recovering and sequences and sequences in the contains and recombination will not recate new contains and recovering and sequences and sequences and s types of retrovirus. The promoters provide cell or tissue specific expression, according to which HERV they are derived from

The present sequence is that of a phosphorothioate oligonuclectide containing 20 T nucleobases, each having a 2'-methoxyethoxy group on its containing 20 T nucleobases, each having a 2'-methoxyethoxy group on its produced according to the methods of the invention. The invention produced according to the methods of the invention of mixed backbone oligomeric, or chimeric, compounds having phosphoiseter internucleoside linkages in addition to phosphorothoate and/or phosphoramidate internucleoside linkages. The methods also include incorporation of nermothosphate internucleoside linkages. The methods utilise H-phosphonate internucleoside linkages. The methods utilise H-phosphorothioate, phosphorotamidate to boranophosphate internucleoside linkages. Each contiguous region is subsequently oxidized to phosphorothioate, phosphoroamidate or boranophosphate internucleoside linkages prior to further elongation. Mixed backbone oligomeric compounds of the invention are prepared using novel oxidation steps that oxidize a region of 1 or more H-phosphonate configurated regions of 1 or more H-phosphonate internucleoside linkages without degrading existing linkages that have been previously oxidized region of 1 or more H-phosphonate been previously oxidized a region of 1 or more H-phosphonate been previously oxidized a region of 1 or more H-phosphonate configured in the nucleoside compounds of the invention are prepared using primers in PCR, probes, linkers, gene fragments and for other diagnostic reters on e.g. blological tissue, fluid, cells etc., as research reagents,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preparation of mixed backbone oligomeric compounds useful as e.g. primers for diagnostic tests, involves oxidation of H-phosphonate internucleoside linkages to phosphodiester internucleoside linkages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= b

The present invention relates to human testis expressed Patched like C protein (HTPL, see ABV7875 to ABV78762 and ABB98519 to ABB98520). HTPL protein (HTPL, see ABV7875 to ABV78762 and ABB98519 to ABB98520). HTPL consider the single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-16, for long). HTPL codon in HTPL-8 (S for short) compared to HTPL-16, for long). HTPL codon in HTPL-8 (S for short) expension with the Patched protein. The shared errotural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL gene was useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of HTPL. Such disorders include disorders of testis, or adrenal, and the HTPL Such disorders include disorders of testis, or adrenal, and the HTPL protein marker and potential therapeutic acids are collingally useful diagnostic markers and potential therapeutic acids are male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAB3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of errythropoletin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, gene therapy, tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                           This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, harppre. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The mucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPPE is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPPE isoform mRNA in chorionic villus samples, and the proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                           New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy
                                                                                                                                                                                                                                  Example 2; Page 126; 353pp; English

New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy

Sxample 2; Page 125; 353pp; English.

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein ${\rm E}_{\nu}$

hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic used in playapetide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of the level of PAPP-E is used in the antenatal diagnosis of an aborting pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence repersents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention

New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy

Example 2; Page 126; 353pp; English

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hpapp-B. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, heapp-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The mucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or used in pharmaceutical compositions or vaccines for preventing or dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antennally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. Papper E is used in the antennatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the proteins can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies and be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antennatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PAPP-E, human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The mucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaccutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the proteins can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CDPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions contact are related to or will respond to the levels of LCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, casciated with the level of CLCA1, where the invention further comprises associated with the level of CLCA1, where the invention further comprises treatment, for example, oxygen therapy, bronchodilators, corticosteroids, treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The camine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an electromagnetic acid molecule of the invention
                                                                                                                                                                       Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ1; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ1, MDZ1. MDZ3 is concoded at chromosome 7022.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11 2 and MDZ12 is encoded at chromosome 16p12 or in manufacturing a medicament for treating or preventing a disorder or increased expression or activity of MDZ3, MDZ4, MDZ1, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ7, or MDZ12 genetic locus. The probes are protein are useful as therapeutic agency or as proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9. .10

                                                                                              The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse translation, and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9. .10

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified decoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation.

They are useful for selectively or decreasing translation.

They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA much as cellular mRNA or viral RNA, to hybridising to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) and degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= b

                  The invention relates to an acyclic linker-containing cligonuclectide comprising at least one modified decoxyribonuclectide. Oligonuclectides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel acyclic linker-containing oligonucleotide useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified decxyribonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= b

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA, or viral RNA, to hybridishe to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification of the invention

They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to cell thuman RNase (ribonuclase) H degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, ubiquitin protein ligase E3A; UBE3A; haplotype, SNP; gene therapy; Angelman syndrome; human papilloma virus E6-associated gene; single nucleotide polymorphism; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel genetic variants of ubiquitin protein ligase E3A gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. Angelman syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ubiquitin protein kinase E3A (human papilloma virus E6-associated protein) UBE3A coding sequence and protein. Also described are a number of single nucleotide polymorphisms (SNPs) identified within these fragments. The fragments can be used in the gene therapy of Angelman syndrome and to haplotype the UBE3A gene. The present sequence is an allele specific primer for a coding sequence fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides the sequences of fragments of the human

The invention describes an isolated human pyridoxal (pyridoxine, vitamin B6) kinase, (PDXK) polynucleotide. The polynucleotide is useful in studying the expression and function of PDXK, and in expressing PDXK protein for use in screening for candidate drugs to treat PDXK related diseases and for therapeutic purposes. A transgenic animal is useful for studying expression of the PDXK isogenes in vivo, for in vivo screening and testing of drugs targeted against PDXK protein, and for testing the efficacy of therapeutic agents and compounds for autoimmune polyglandular disease type I. The pulypeptide is useful for studying the effect of the variation on the biological activity of PDXK and the binding affinity of candidate drugs targeting PDXK for the treatment of autoimmune polyglandular disease type I. Genotyping and haplotyping is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with PDXK as a candidate agent for treating a specific condition or disease predicted to be associated with PDXK activity, and in the design of clinical trials of candidate drugs. This sequence is one of 37 (see Alinical trials of candidate drugs. This sequence is one of 37 (see Alinical trials of candidate drugs. This sequence is one of 37 (see Alinical trials of candidate drugs. This sequence is one of 37 (see Alinical trials of candidate drugs. ```
The present sequence can be used in a novel method for detecting a eukaryctic pathogen in a patient. The method comprises obtaining a sample of somatic tissue or cells from the patient, determining if telomerase activity is present and correlating this with the presence of the pathogen. The method is useful for diagnosis of fungal infections, especially a fungus of the genus Candida, Kluyveromyces, Saccharomyces, Sporothrix, Coccidioides, Histoplasma, Blastomyces, Pascocidioides, Cryptococcus, Aspergillus, Mucor or Rhizopus, or malarial infections, especially plasmodium vivax, P. ovale, P. malariae or P. falciparum. (Updated on 25-MAR-2003 to correct PA field.)

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleoride, (for Insulin-like Growth Factor IGRF) is receptor, IGF binding protein [IGFRF] -2 or IGFRF3), which is capable of inflammation and/or other disorders. The present sequence is an inflormation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153 - F45161). The method is useful for ameliorating the effects of psoriasis, in tyriasis, ruba, pilaris, serborthoea, keloids, keratosis, neoplasias, soleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brine is skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1.3%; Score 13.4; DB 1; Length 15; 33.3%; Pred. PTGS2 allele specific oligonucleotide probe SEQ ID 25.

Human; prostaglandin-endoperoxide synthase 2; PTGS2; cyclooxygenase 2; single nuclectide polymorphism; SNP; immune-related disorder; arthritis; inflammation; probe; ss.

Homo sapiens

```
This invention relates to a polymucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence AAPR0896 contains 27 single nucleotide polymorphisms (SNP8). AAPR0896 and AAPR0897 represented by AAPR2199. The invention includes PCR and the PTGS2 gene and coding sequence, and the PTGS2 gene sequence, and to contain a represented by AAPR2199. The invention includes PCR and to contain and probes represented in AAPR0898 - AAPR81151 which are used to isolated and characterise the PTGS2 gene sequence, and to compare the positions of the SNPs. PTGS2 proteins and polymucleotide compressing PTGS2 broteins, for structural analysis or drug-binding studies and also in gene therapy (either consecution or diagnosis, prognosis and also in gene therapy (either consecution polymorphisms and used to determine PTGS2 haplotype and genotype, consecution to determining association between a particular trait, eggenetially for determining association between a particular trait, ergo susceptibility severity or stage. Anti-PTGS2 bathologies are particularly consecuted to susceptibility severity or stage. Anti-PTGS2 antibodies are particularly consecuted as architic tests and treatments for immune related disorders such as architic and inflammation. The polymorphisms may also be used to study expression and biological function of PTGS2. Transgenic soluminals that expression and biological function of PTGS2 ransgenic confecution and profession of pTGS2.
                                                                                                                                                                                                                                                                                                       New nucleic acid containing polymorphisms in the cyclooxygenase-2 gene, for gene therapy of inflammation and for establishing a genotype or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, PowPoUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse durg-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogensemia, spinal and bulbar attophy and spinocereballar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human BST8
                                                                                                                                                                                                                                                                             Identifying a candidate polymorphic repeat within a coding sequence, funderstanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnostic; Gram-positive bacterium; high G+C content; amplification; mycobacterial infection; PCR; primer; probe; detection; ss.

This invention describes a novel method for the diagnostic detection and/or identification of Gram-positive bacteria that have a high G+C content, especially Mycobacteria. The method comprises subjecting a sample to nucleic acid amplification using the PGR primers represented in ABX94483-ABX9492. The amplification mixture, or part of it, is then tested for hybridisation to at least one of the probes represented in ABX94493-ABX94524 which can be immobilised on a solid phase or used in kit form. The specified primers/probes provide highly specific detection of particular Gram positive bacteria, which are difficult to differentiate by morphological or biochemical tests and/or those which take a long time to test because of their slow growth
                                                                                               Detecting and identifying Gram-positive bacteria of high G/C content, useful particularly for diagnosis of mycobacterial infection, by specific amplification and hybridization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating condition associated with cell senescence or increased rate of cell proliferation, by administering to cell an agent that derepresses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell proliferation, cell senescence; telomere length; telomerase activity; cel replication; neoplasia; cancer; age-related macular degeneration; Alzheimer's disease; atherosclerosis; telomerase inhibitor; immortalised cell; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Telomere length and/or telomerase activity related polynucleotide #51

telomerase in the senescing cells or that reduces loss of telomere

Disclosure; Page 50; 86pp; English.

The invention describes a method use for treating increased rate of proliferation of a cell or extending the ability of a cell to replicate, or treating a disease associated with cell sensecence. The method comprises administering an agent to reduce loss of telomera length within the sensecing cells. The method is useful for treating a condition associated with an increased rate of proliferation of a cell extending the ability of a cell to replicate, or for treating a condition condition associated with cell sensecence e.g. neoplasia. A second method disclosed in the invention is useful for treating a condition associated with an elevated level of telomerase activity within a cell e.g. cancer. This of isclosed is a method useful for treating a condition associated with an increased rate of proliferation in a cell in an individual e.g. age-related macular degeneration, astrocytes associated with Alzheimer's equence represents a polymuclecule used in the study of telomera length centering and telomerase activity described in the invention

New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb, for treating restenosis or cancer.

Claim 1; Page 78; 128pp; English.

The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor

ö line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mENA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave hyperproliferation in restenosis, especially after coronary angiophasty, and in cancers Gapa ö 1.3%; Score 13.4; DB 1; Length 17; 46.7%; Pred. Determining binding affinity of a ligand to an oligonucleotide sequence in double stranded form, comprises measuring the effect of adding increasing amounts of a ligand on a signal generated by two indicator oligonucleotides of the duplex.

Example 3; Page 19; 78pp; English.

The invention relates to new methods of determining the binding affinity of a ligand to an oligomucleotide sequence, particularly to a duplex. The ligand is typically a metal lon, a small organic or inorganic molecule, a protein or a multi-protein complex. The methods comprise measuring the protein or a multi-protein complex. The methods comprise measuring the ceffect of adding inoreasing amounts of a ligand on a signal generated by two indicator oligomucleotides of the duplex. In the absence of ligand, conditions are such that the oligomucleotides exist primarily in single stranbilises the duplexs, such that duplex formation is favoured. One of the indicator oligomucleotides contains a first group capable of producing a detectable signal, while the other indicator oligomucleotide contains a second group that on hybridisation of the two indicator molecules, will detectably alter the signal produced by the first group. The signal independence of decreased on hybridisation. For example, the pairs of signalling groups used could be a radioactive group and a contillant (where an increase in signal intensity indicates that

```
hybridisation has taken place) or a fluorophore and a fluorescence quencher (where a reduction in signal intensity indicates that the training intensity indicates that the hybridisation has occurred). Other methods of the invention comprise a crand diplacement assay, where the ability of an unlabelled displacement strand to displace one of the oligomolectides in the duplex is determined in the absence and presence of ligand; and a competition assay, where an unlabelled single or double-stranded competition of ignounclectide is added to the ligand-bound indicator duplex, and the effect on the signal produced from the indicator duplex, and the methods are useful for determining the binding affinity of a ligand to an oligomuclectide sequence. They are particularly useful for determining callicity binding affinities of various ligands to various oligomuclectide sequences. The sequences, particularly double-stranded oligomuclectide sequences. The sasays allow rapid and convenient determination of mucleic acid binding specificities. Sequences AAA10342-A10391 represent competitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI32073 targressent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cancer also used for detecting cell type differentiation. ABC00010-ABC99999, ABF00010-ABF99999, ABH00010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligonucleotide SEQ ID NO 190379 for detecting SNP TSC0046825.

Claim 1; SEQ ID NO 190379; 29pp + Sequence Listing; German.

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99899 and ABT00010-ABIS2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and dycoslie methylation status in chemically pretraeted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABF00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, coingomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 8s; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretracted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form par of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide SEQ ID NO 119128 for detecting SNP TSC0029746.
                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 88054; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99989, ABH00010-ABH99899 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABF99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NoTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from NIPO at
central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABF00010-ABF99889, ABF00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fib.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosie; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Set of oligonuclectides, useful for diagnosis and cell typing, idesigned to detect single-nuclectide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide SEQ ID NO 82341 for detecting SNP TSC0020792.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID NO 82341; 29pp + Sequence Listing; German.

This invention describes novel oligomucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABC0010-ABF99989, ABH00010-ABH99989 and ABI00010-ABIS2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting call type differentiation. ABC0010 -ABC99989, ABR00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form par of the printed specification, but ftp.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF32073 data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                  Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cyclosine methylation status in chemicaally pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABF99899 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligonucleotide SEQ ID NO 37127 for detecting SNP TSC0011593.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1.2%; Score 13; DB 1; Length 13;

This invention describes novel oligonucleotide primers or peptide nucleic acid [PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99999, ABF00010-ABF99999, ABH00010-ABH99999 and ABI00010-ABI22073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for disponsis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but
